**Introduction**

This information sheet provides interim Infection Prevention and Control guidance when novel coronavirus (nCoV) is suspected/confirmed in a patient in a hospital or similar health care setting.

**General Principles of Infection Prevention and Control to Prevent or Limit Transmission Of nCoV**

1. Early recognition and source control
2. Application of Standard Precautions for all patients
3. Cough etiquette and respiratory hygiene
4. Implement Transmission Based Precautions
   - **Contact and Droplet** Precautions (except for aerosol generating procedures or critically ill patients with high volume/high frequency, prolonged care)
   - **Airborne** Precautions for aerosol generating procedures (critically ill patients with high volume/high frequency, prolonged care)
5. Hand Hygiene (5 moments)
6. Environmental Cleaning

**Application of Standard Precautions**

1. Offer a surgical/procedural mask for suspected (symptomatic) nCoV infection:
   - Perform hand hygiene after contact with respiratory secretions.
2. Perform Hand Hygiene before and after contact or before and after any procedure.
3. For risk of exposure to blood and body substance don appropriate PPE.
4. Environmental cleaning.

**Collecting Specimen Samples**

When collecting respiratory specimens, transmission-based precautions should be observed whether or not respiratory symptoms are present.

For most patients collection of respiratory specimens is a low risk procedure and can be performed using **contact** and **droplet** precautions:

- Perform hand hygiene before donning gown, gloves and surgical mask; add eye protection as per standard precautions
- To collect throat or nasopharyngeal swab stand slightly to the side of the patient to avoid exposure to respiratory secretions, should the patient cough or sneeze.
- At completion of consultation, remove personal protective equipment (PPE) and perform hand hygiene, wipe any contacted/contaminated surfaces with detergent/disinfec tant.

**Patient with severe symptoms**

If the patient has severe symptoms suggestive of pneumonia, e.g. fever and breathing difficulty, or frequent, severe or productive coughing episodes.
then contact and airborne precautions should be observed:

- If possible, specimens should be collected in a negative pressure room (e.g. in a hospital setting).
- If this is not possible, then collect the specimens in a room with the door closed and leave. The room should be left vacant for at least 30 minutes after specimen collection (cleaning can be performed during this time by a person wearing PPE).

- Perform hand hygiene before donning gown, gloves, eye protection (goggles or face shield) and a P2/N95 respirator – which should be fit checked.

- At completion of consultation, remove gown and gloves, perform hand hygiene, remove eye protection and P2/N95 respirator. Do not touch the front of any item of PPE during removal, perform hand hygiene.

- The room surfaces should be wiped clean with disinfectant wipes by a person wearing gloves, gown and surgical mask.

### Standard Precautions

(See Infection Control Handbook for greater details not covered here).

Standard Precautions are a set of infection control practices used to prevent transmission of diseases that can be acquired by contact with blood, body fluids, non-intact skin (including rashes), and mucous membranes. They are applied to all patients regardless of suspected or confirmed infectious status. The application of PPE is based on anticipation of any blood or body substance exposure and the required mitigating PPE.

### Transmission Based Precautions\(^{2,3,4}\)

(See Appendix 1, 2 & 3)

**CONTACT and DROPLET PRECAUTIONS**

In addition to Standard Precautions, Contact and Droplet precautions are the minimum recommended precautions for routine care of patients with suspected and confirmed nCoV infection.

On presentation or admission the patient should be:

1. Given a surgical mask to put on, and
2. Placed in a single isolation room
3. Hand Hygiene (5 moments).

### Personal Protective Equipment (PPE)

For most inpatient contacts between healthcare staff and patients the following PPE is safe and appropriate and should be put on before entering the patient’s room:

- long-sleeved gown
- surgical mask
- face shield or goggles
- disposable nonsterile gloves when in contact with the patient (hand hygiene before donning and after removing gloves).

### Other Precautions

1. Use disposable equipment or dedicated equipment.
2. Avoid transferring patient out of room or area unless medically necessary. Where required patient to wear surgical/procedural mask
Infection Prevention and Control
Novel Coronavirus 2019 (2019-nCoV) – Hospital setting

during transfer and follow respiratory hygiene and cough etiquette.

3. Limit number of HCWs, family members and visitors in contact with a patient with suspected/confirmed nCoV.

AIRBORNE PRECAUTIONS

The potential for airborne spread of nCoV is still unknown, but contact and airborne precautions should be used routinely for AGPs, which include:

- tracheal intubation, non-invasive ventilation, tracheotomy, cardiopulmonary resuscitation, manual ventilation before intubation, and bronchoscopy (and bronchoalveolar lavage), high flow nasal oxygen
- taking samples from severely ill patients with symptoms suggestive of pneumonia, e.g. fever and breathing difficulty, or frequent, severe or productive coughing episodes.

Airborne Precautions may also be applied as risk assessed to:

Patients suspected/confirmed and admitted to hospital that are critically ill patients with high volume/high frequency, prolonged care.

1. Place in negative pressure isolation room, door closed (where available)
2. Adequately ventilated Single room with door closed could be used in addition to airborne precaution PPE for staff
3. Limit people in room when performing procedure.

Personal Protective Equipment (PPE)

PPE for contact and airborne procedures should be put on before entering patient’s room:

- Fluid resistant long-sleeved gown
- P2/N95 respirator (mask) – should be fit-checked with each use
- face shield or goggles
- disposable nonsterile gloves when in contact with patient (hand hygiene before donning and after removing gloves)

P2/N95 respirators (mask) should be used only when required and fit checked with each use.

Only PPE marked as reusable should be reused following reprocessing according to manufacturer’s instructions, all other PPE must be disposed of after use.

Staff should be trained in the correct use of PPE, directed by Infection Prevention and Control. Incorrect removal of PPE is associated with a risk of contamination.

Contact and airborne precautions are recommended when performing aerosol generating procedures (AGPs: see below).

Airborne Precautions, Aerosol Generating Procedures (AGPS) and Room Management

Some aerosol generating procedures have been associated with increased risk of transmission of coronaviruses (SARS-CoV and MERS-CoV) such as: tracheal intubation, non-invasive ventilation,
tracheotomy, cardiopulmonary resuscitation, manual ventilation before intubation, bronchoscopy, and nebulised medications.\(^7,8\)

Ensure that HCWs performing aerosol-generating procedures:
- Use a P2/N95 respirator mask
- When putting on a P2/N95 particulate respirator, always perform the seal-check\(^6\)
  Note that if the wearer has facial hair (beard) this can prevent a proper respirator fit\(^6\)
- Eye protection – goggles or face shield

The requirement to leave a room vacant following a patient in airborne precautions or an AGP is associated with risk of airborne particles and the time lapse required for enough air changes to remove potentially infectious material (see Table below).

If AGPs were performed or patient cared for under airborne precautions, then room does need to be left vacant for at least 30mins for ventilation clearance after the patient has left. Staff can enter the room during this time for cleaning providing PPE as per airborne precautions is worn.

Areas in the facility where suspect or confirmed cases have been cared for without AGPs being performed do not need to be left vacant for any time period and the staff cleaning areas should wear appropriate PPE: Long sleeve gown, Gloves, surgical mask and protective eyewear or facial shield (as per standard precautions) when cleaning.

### 1. Airborne Contaminant Removal

Environmental Cleaning

Cleaning and disinfection is recommended to decontaminate the environment: (2 step clean or 2 in 1 step clean).

- Patient room should be cleaned daily.
- Cleaners should observe contact and droplet precautions
- Ensure adherence to the cleaning product manufacturer’s recommended contact time
- Use products with demonstrated efficacy against enveloped viruses (as the easiest class of microorganisms to kill) \(^{(10)}\)
- Terminal Clean on discharge from room
- Minimise equipment and items in the patient areas

NB: if unsure of properties of your disinfectant use of a chlorine based product such as sodium hypochlorite is the recommended solution for disinfection).

Handling of Linen

Handle per normal procedures.
All linen is treated as potentially infectious and processes in place are currently adequate.
Grossly contaminated/soiled linen should be placed in a soluble plastic bag and then placed in the linen skip or the linen skip should be lined with a plastic bag for soiled linen.

Food service Utensils

Manage in accordance to routine procedures.
Units may choose to implement disposable items to reduce handling by staff.

Waste Management

Waste to be disposed of in normal clinical waste streams.

All non-clinical waste is disposed of into general waste stream.

Management of Deceased Bodies

Normal processes apply to the management of deceased bodies. Staff handling deceased should wear PPE Gown, Gloves, Mask, shield/goggles.

Recommend body to be placed in hermetically sealed bag.

### Novel Coronavirus 2019 (2019-nCoV) – Hospital setting

### Requirements & Droplet Precautions

<table>
<thead>
<tr>
<th>Requirements</th>
<th>Droplet Precautions</th>
</tr>
</thead>
</table>
| Single room                       | Yes, or cohort with patient with same pathogen (in consultation with infection control professional, or infectious diseases physician), or maintain spatial separation of at least one metre.  
It is recommended that single patient rooms be fitted with ensuite facilities. In the advent of no ensuite facilities, a toilet and bathroom should be dedicated for individual or cohort patient use. |
| Negative pressure*                | No                                                                                  |
| Hand hygiene                      | Yes                                                                                 |
| Gloves                            | Standard Precautions                                                                |
| Gown/apron                        | Standard Precautions                                                                |
| Mask                              | Yes, Surgical mask. Remove mask after leaving patients room.                         |
| Protective eyewear                | Yes                                                                                 |
| Special handling of equipment     | Standard Precautions                                                                |
| Transport of patients             | Surgical mask if coughing/sneezing and other signs and symptoms of an infectious transmissible disease spread by airborne or droplet route.  
Surgical mask for patient when they leave the room.  
Patients on oxygen therapy must be changed to nasal prongs and have a surgical mask over the top of the nasal prongs for transport (if medical condition allows).  
Advise transport staff of level of precautions to be maintained.  
Notify area receiving the patient. |
| Alerts                            | When cohorting patients, they require minimum of one metre of patient separation.  
Visitors to patient room must wear a fluid resistant surgical mask and protective eyewear and perform hand hygiene.  
Patient Medical Records must not be taken into the room.  
Signage of room. |
| Room cleaning                     | Cleaning and Disinfection                                                           |
